

### 1. What I learned in the trip

First, I was very surprised that there was a city which introduced solar system positively. In Japan, it may be effective that local authorities move antecedent to government as introducing such energy system and network.

Second, even Iida city, introduce of biomass system is difficult. I felt that an idea of biomass energy was abstract in comparison with solar system.

### 2. Further questions/issues

First, I want to investigate the background of starting solar system in Iida city. It is unclear why many citizens agreed with the plan. In the case of applying the system to other cities, we have to consider their special characteristics, for example, history, geographical features, industry and so on. So, I want to research such things in Iida city and find primary factor of success.

Second, it is related to first things, I want to know the opinions of citizens and local government, because we could hear explanation from only Ohisama fund in this trip.

Third, I want to examine how continuable the fund is. In my opinion, the fund system may be difficult to continue because amount of fund don't increase these days and aren't stable. We should observe that and conclude whether it can continue or not.

### 3. Any other things

I was very happy to see the making process of mushrooms.

I wanted to stay the Japanese hotel(minshuku) because it was very gorgeous and it also had hot-springs.
